

# MANAGE

## Manage

The process of efficiently and effectively planning and organizing tasks until completed.

## Why Manage?

The complexity and detection of network attacks is increasing becoming more difficult. Equally as important is the numbers of day to day tasks Network Administrators are responsible. Proper network security management is critical to overall stability, uptime and day to day business operations.

## How do we do it?

Paritra Security Solutions combines easy to use and flexible management applications with wizard based interface technology to reduce and simplify tasks associated with network issues. Web based tools and monitoring allows automated configuration deployment and problem resolution. Service capability reports provide one stop view in to state of network services that are enabled/disabled or supported/not supported for all network devices, extending the view to providing reasons what needs to be upgraded (SW or HW) in case a service is not supported. Configuration database provides views in to the change management including who made the changes and what changes are made.

## Pari Networks Components Used

### Dashboard

Provides node explorer view, network wide views for device types, software inventory, module information, etc.

### Reports

Generates Network inventory reports, EOL/EOS reports, Service reports, Hardware and Software status and statistics, Interface status and statistics, Service reports, Capability reports, logging and traffic flow reports.

### Audit

Security feature management, configuration and traffic flow monitoring, network device management.

### Configuration

Conducts device management, system and user credential validation, device and interface group configuration, configuration archival.

## About Us

Pari Networks provides effective and easy to use security risk management solution. We have a patent pending approach for combining network operations, regulatory/corporate compliance, security assessments and remediation actions. This enables simplified administration of networks ensuring secure and regulated business operations for our partners and customers.
